Trip Risk Monitor

What it watches, how to read it, and what to do when a trip is at risk

AUDIENCE
Operations staff and partners
Arte Voyages trip teams

AUTHOR
Charanjeeth Shasta Pendam
Software and AI Engineering Intern

DATE AND SCOPE
7 November 2026
Live mode and Manual mode

1 What the monitor does

The monitor watches free public hazard feeds every 30 minutes: earthquakes, cyclones, floods, storms, heat, unrest and news. It compares each hazard with every planned trip leg, meaning a city and its travel dates, and gives the leg a risk tier. You are emailed only when a tier changes, so a quiet inbox means nothing has changed.

COUNTRIES COVERED: India · Nepal · Bhutan · Sri Lanka · Maldives

2 How it works for you

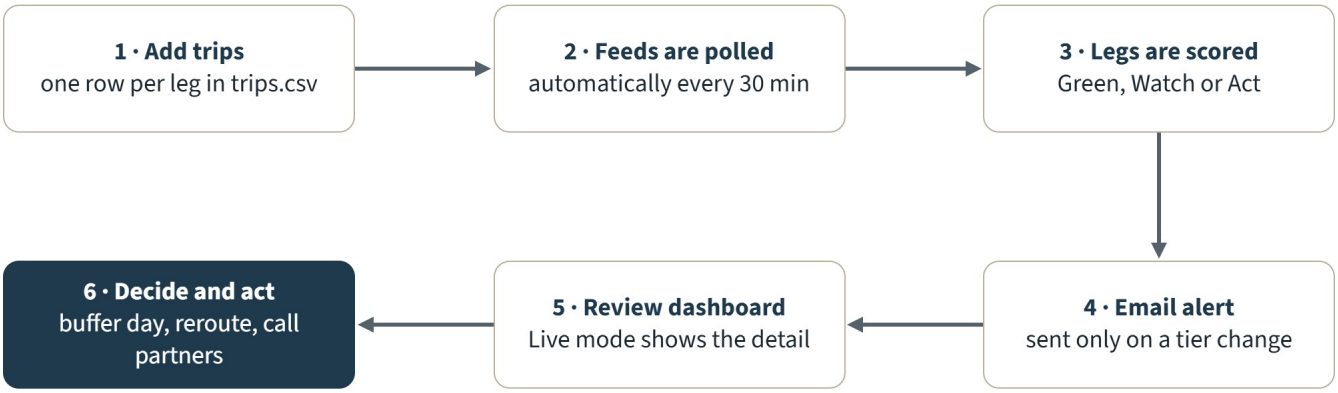

Figure 1 — Steps 1 to 3 run by themselves; you take part in steps 1, 5 and 6.

3 Reading the tiers

Green · score below 0.15	Watch · 0.15 to 0.45	Act · 0.45 and above
Meaning. No active hazard near the leg during its dates. **Action.** None.	**Meaning.** A hazard is close enough in space and time to matter. **Action.** Monitor closely.	**Meaning.** A significant hazard overlaps the leg. **Action.** Review now; consider a buffer day or reroute and contact partners.

These are the default thresholds. They can be changed only inside Manual mode, which is a simulation and never alters live tiers.

4 Who uses it

Operations coordinator
Receives alert emails, checks the Live dashboard daily and decides what to do about Watch and Act legs.

Trip planner
Keeps trips.csv up to date and uses Manual mode to test what-if scenarios before a client call.

Partner or account contact
Is told when a leg reaches Act and agrees buffer days, reroutes or hotel changes.

Typical roles. One person can hold several of them.

5 Adding and editing trips

Trips live in one file, trips.csv. Each row is one **leg**: one city for one date range. A trip through three cities is three rows.

COLUMN	EXAMPLE	RULE
`trip_id`	DELHI-01	A unique name for the leg; it must not be empty
`country, city`	India, Delhi	One of the five covered countries
`lat, lon`	28.61, 77.20	Decimal degrees of the place; distances are measured from here
`start_date, end_date`	2026-12-10, 2026-12-15	Format YYYY-MM-DD; the end must not be before the start

If a row is wrong, it is skipped with a warning and the other rows still load. If the file is missing, nothing is monitored. Once a leg's end date has passed, it is reset to Green and one CLOSED alert is sent.

6 Reading the Live dashboard

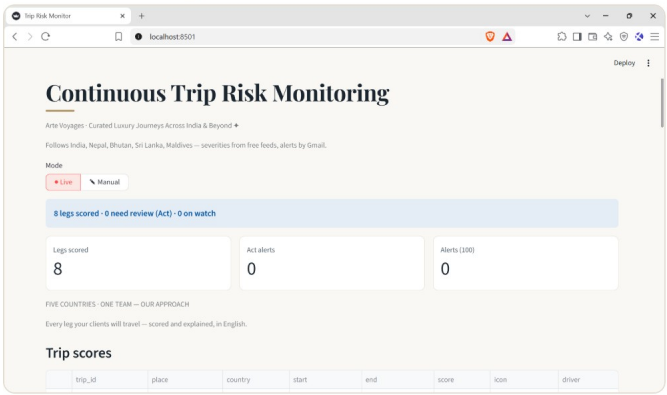

Figure 2 — Live mode: mode switch, summary line and KPI cards.

Mode switch. Live shows real data; Manual is a simulation.

Summary line. Legs scored, how many need review (Act), how many on watch.

KPI cards. Legs scored, Act alerts, and the last 100 alerts.

Trip scores. Table and bar chart with score, tier and driver.

Map. Every leg, coloured by tier.

14-day outlook. Score trend against the 0.15 and 0.45 lines.

Alert feed and feed health. Filter by tier or kind; check when each feed last succeeded.

ESCALATED — the tier went up. Shown at once.

DE-ESCALATED — the tier went down, after 48 hours below.

CLOSED — the leg has ended and was reset to Green.

Alert kinds you will see in the alert feed and in emails. Tiers always appear as colour plus text.
